eTac TRACKLESS
BOND COAT

Maximum bond. Minimum cleanup.

eTac creates a long-lasting, no-slip bond between asphalt layers without tracking — keeping equipment clean and improving production. This bond coat is formulated to allow for jobsite storage and can be applied at normal-to-high shot rates using conventional equipment.

Give your roads their best shot at a long life cycle.

Build A Road That Stays Put.

eTac is an innovative trackless bond coat emulsion that provides adhesion between asphalt layers, extending the life cycle of your roads and protecting against distresses like cracking and rutting. Properties within eTac allow it to perform at heavier rates than other bond coats. Its firm grip on asphalt layers creates maximum strength while reducing the chance of slippage, providing a durable and safe pavement for the traveling public.

Quick & Easy

eTac is storage stable, extremely easy to apply using conventional equipment, and fast-breaking for a quick start to paving operations.

Trackless

Designed to hold tight to asphalt layers, but not to tires and equipment, eTac keeps cleanup to a minimum and saves valuable production time.

Bonded For Safety

A proper bond means less maintenance is required in the future, and less exposure to traffic for maintenance crews. The bond created by eTac melds asphalt layers into one cohesive unit which prevents slipping and sliding, and provides maximum strength for a smooth, safe road.

 The fact that eTac is trackless makes this bond coat extremely user-friendly and unparalleled in its effectiveness, which benefits the agency, the contractor and the taxpayers.

“ [eTac] is great...performs the same every time. We were able to get back in the mat within 10 minutes, which really helped our production. ”
